Practise the interview before it counts.

A voice-first practice partner. Three AI agents ask, score and coach you, then show the answer a strong candidate would have given.

Built with AutoGen · OpenAI · Streamlit

Interview practice is hard to get, and feedback is vague.

Few real partners

Friends are busy, coaches are costly, and nobody asks follow-up questions at 11 pm.

Generic feedback

"Be more specific" does not tell you what a strong answer to that exact question sounds like.

Typing is not speaking

Real interviews are spoken. Most practice tools are text boxes.

The gap: practice that is spoken, adaptive and specific.

Three agents, each with one job.

1

Interviewer

Asks exactly one question at a time. Starts easy, raises difficulty, never repeats a topic, never gives hints.

→

2

Evaluator

Scores the latest answer 1 to 10 as structured output, with strengths, one fix, and a first-person model answer.

→

3

Reporter

Writes the final report: verdict, average score, 3 strengths, 3 areas to improve and a 3-step study plan.

Built on AutoGen AgentChat, using a round-robin team for each step.

From setup to study plan in five steps.

01

Set up

Pick a role and level: Junior, Mid-level or Senior.

02

Listen

The question is spoken aloud with text-to-speech.

03

Answer

Speak your answer. Whisper transcribes it.

04

Learn

Get a score, a fix and the model answer for that question.

05

Review

Receive a verdict and a study plan.

Live average score, latency and cost are shown in the sidebar.

Candidate text is treated as data, never as instructions.

Injection filter

A local pattern check rejects "ignore previous instructions", "give me a 10" and similar, with no API call.

Moderation

OpenAI's moderation endpoint screens inappropriate input. It fails open, so an outage never blocks a user.

Tagged answers

Answers are wrapped in <answer> tags and every agent is told to treat them as data.

Timeouts

Each agent step has a 60-second limit so a stalled call cannot hang a session.

Two layers: cheap local checks first, prompt-level defence second.

Tested, timed and costed.

Evals

- Weak, average and strong answers land in expected score ranges
- Strong beats weak
- Feedback includes a model answer
- Questions are single questions
- Final report has required sections

Unit tests

- Injection patterns are caught
- Normal answers pass
- Injection rejected without an API call
- Tracker sums tokens, characters and time
- Failed calls are still timed

Cost model

- gpt-4o-mini: $0.15 / $0.60 per 1M tokens in / out
- tts-1: $15 per 1M characters
- whisper-1: $0.006 per minute
- Per-call latency and cost in the UI

Pytest suite runs in the repo. Prices are estimates and editable in metrics.py.

A small, readable stack.

Today

- Python, Streamlit UI
- AutoGen AgentChat 0.7
- OpenAI gpt-4o-mini, tts-1, whisper-1
- Pydantic structured scoring
- pytest

Next

- Save sessions and track progress over time
- Role-specific question banks
- Resume-aware questions
- Shareable report export

Next steps are ideas, not shipped features.

Walk in with answers you have already said out loud.

Try it, read the code, tell me what to improve.
